Agenda

● The CLI world today for:
  ○ Drupal core
  ○ Drupal sites

● Proposal: Add drush/drush to drupal/recommended-project
  ○ Benefits
  ○ Considerations

● Open Discussion
Today’s Drupal Core

- DbDumpCommand. Mysql only. No --structure-tables, --extra-dump.
- InstallCommand. Sqlite only. No multisite. No install profile fields.
- ServerCommand (aka runserver).
Today’s Drupal Sites

- composer create-project drupal/recommended-project. [Docs.]
- composer require drush/drush
  - Install/Uninstall/List modules
  - Login as any user, import config, security-php, deploy
  - Sql:*, rsync

Replying to @wizonesolutions

Not sure if dead but in hiatus yes. But even if death @drupalconsole did a really important task. Modernize the @drupal CLI world and make @DrushCli follow our path of take advantage of OOP and @symfony components. I may write a blog post related to all this story and the drama.
Proposal

1. Add drush/drush to 
   [drupal/recommended-project](https://drupal.org/recommended-project)

2. Current Drupal core commands remain Symfony Console commands. They exist for testing core.
Benefits

- OOBE - a robust commandline for all sites.
- Consistent documentation (e.g. installation).
- Contrib & core confidently ship with Drush commands.
- Security. All sites can monitor their non-Drupal dependencies.
- The new `deploy` command standardizes Drupal deployment.
- Leverage 10+ years of development
Considerations

- Release Management coordination
- Security Team coordination
- Core and Drush have separate issue queues and repos.
- Testing. Drush is functionally tested for many permutations (PHP version, Drupal core version, DB backend, etc). Drupal is not mocked.
- Sites can easily opt-out: `composer remove drush/drush`
